Introduction

The optode cable is the component of the NIRScoutX™, NIRScoutXP™, NIRSport™, and NIRSport 2™ systems. The NIRx NIRScout and NIRSport Near Infrared Spectroscopy (NIRS) imaging system is intended for non-invasive transcranial Near-Infrared Spectroscopy (NIRS) of blood perfusion dynamics in the human head. The optode cables provide power, ground, and signal lines to and from the source and detector optodes.

These Specifications cover the Optode Cable version 2.0. The Optode Cable version 1.0 was used before v2.0 was designed in 2022-2023.

To avoid the new cable looking similar to the existing Brain Products cable, the raw cable manufacturer E&E changed the color of the wires with the cable. The colors of the wires in the new cable are fixed, and these are blue, brown, and green. The table above maps the old wires' colors and the colors of the wires in a cable specially developed for NIRx by E&E.
